## **Harborwalk Marina & Yacht Club Quickly Resumes Business After Ike**

### **Sound Construction Principles** **Create Protected Investments**

When hurricane Ike tore across Galveston in September 2008 it left a path of devastation unseen in the region for 25 years but the **vinyl bulkheads at Harborwalk remained intact**. In fact, most of the buildings and structures at Harborwalk are of such excellent quality they sustained only minor damage from hurricane Ike **allowing Harborwalk to quickly resume business**.

There are **no guarantees against hurricanes** – especially for bulkheads. Luckily, when the visionary developers at Watkins Properties built Harborwalk Marina and Yacht Club on the waterfront near Galveston, TX they understood that the **combination of sound engineering, expert installers, and state-of-the-art bulkhead materials** are required to make bulkheads that last.

There are **3 Required Components of Every Successful Construction Project**:

- Intelligent Design
- Proper Construction or Installation
- Quality Materials

The combination of **these three components ensures your project will be stable and long-lasting**. They are mutually supportive. Each component affects and depends upon the other.

Developers, landowners, and homeowners who build according to these principles **create investments that last and deliver the long-term returns** for which they were built.
